## I. INTRODUCTION

In this report, we utilize 2<sup>nd</sup> and 4<sup>th</sup> order finite difference methods (FDM) to determine their effectiveness in approximating the solutions to axisymmetric heat conduction problems. The heat conduction problems in question are taken from the required textbook for this course<sup>1</sup>, namely problems 115, 116, and 117 at the end of chapter 8. The primary objective of this pursuit is to determine the derivative of the temperature at the outer boundary of the cylindrical pipes of interest for these problems. In order to complete this objective, we first solve for the analytical solutions of the temperature profiles for each problem in section II. In section III, we introduce 2<sup>nd</sup> and 4<sup>th</sup> order finite difference methods for numerically computing the temperature profiles, as well as the derivatives of the temperature profiles. We discuss methods for extrapolating these values to an approximation of the exact solution as well. In section IV, we present graphically the results of applying the difference methods to each problem, for several different values of the spacing of the numerical grids. Finally, in section V we analyze the convergence of the methods employed to the exact solution, as well as to the extrapolated solutions.

## II. FORMULATION OF THE CONTINUOUS MODEL & SOLUTIONS

The three problems of interest all concern the temperature distribution in a radially symmetric pipe. The heat flow,  $Q$ , through a pipe can be represented as the heat flux,  $q(x)$ , multiplied by the total cross sectional area,  $A$ , of the pipe. Using Fourier's law of heat conduction we obtain

$$Q(x) = Aq(x) = -AkT'(x)$$

For simplicity, we assume a unit pipe length, such that  $A = 2\pi x$ . We now set the derivative of the heat equal to a function  $f(x)$  representing internal heating sources,

$$Q'(x) = -2\pi k(xT')' = -2\pi k(xT'' + T') = Af(x)$$

Rearranging terms, we obtain the differential equation,

$$T'' + \frac{1}{x}T' = -\frac{1}{k}f(x)$$

In general, the temperature distribution in an axisymmetric pipe satisfies the differential equation

$$\frac{d^2T}{dx^2} + \frac{1}{x} \frac{dT}{dx} = f(x) \quad (1)$$

where  $T$  is the temperature and  $x$  is the radial distance from the axis of the pipe. The problem statements for each of these problems are shown in Figure 1.

---

<sup>1</sup> Hoffman, Joe. *Numerical Methods for Engineers and Scientists*. Boca Raton: CRC Press, 2001. p.498. Print.

**Problem 115**

$$\frac{d^2T}{dx^2} + \frac{1}{x} \frac{dT}{dx} = 0 \quad 1 < x < 2 \quad T(1) = 100 \text{ and } T(2) = 0 \quad (\text{I})$$

**Problem 116**

$$\dot{q}_{cond} = \text{Fourier's Law} = -kA \frac{dT}{dx} = \dot{q}_{conv} = \text{Robin} = hA(T - T_a) \quad (\text{II})$$

$$1 < x < 2 \quad T_a = 0.0 \text{ C}, h = 500 \frac{J}{s \cdot m^2 \cdot K}, k = 100 \frac{J}{s \cdot m \cdot K}, T(1) = 100, T'(2) = -5T(2)$$

**Problem 117**

$$\frac{d^2T}{dx^2} + \frac{1}{x} \frac{dT}{dx} = A \left[ 1 + \left( \frac{r}{R} \right)^2 \right] \quad (\text{III})$$

$$0 < x < 1 \quad T'(0) = 0 \text{ and } T(R) = 0 \text{ C} \quad R = 1.0, A = -100$$

**Figure 1: Problem 115, 116, and 117 from Feibus "Conduction and Convection in a 1-D Pipe", 2014, p.2.**

Our objective in this section is to determine the analytical solution for the temperature distribution for all three problems.

**II.A. Solution of 115**

To solve (1) for problem 115, we can rewrite (1) in the form,

$$\frac{d}{dx} \left( x \frac{dT}{dx} \right) = 0 \quad (2.1)$$

Integrating (2),

$$x \frac{dT}{dx} = C_1 \quad (2.2)$$

$$T(x) = C_1 + C_2 \ln(x) \quad (2.3)$$

Using the boundary conditions for 115 we obtain,

$$T(x) = 100 \left( 1 - \frac{\ln(x)}{\ln(2)} \right) \quad (2.4)$$

$$T'(x) = -\frac{100}{x \ln(2)} \quad (2.5)$$

**II.B. Solution of 116**

The solution to the problem of 116 has the same general form as (2.3), and the boundary condition  $T(1) = 100 \text{ C}$  can be used to find that  $C_1 = 100$ . The heat conduction equation in Figure 1 can be used to obtain  $C_2$ . Rearranging (II),

$$\frac{dT}{dx}(2) = -\frac{h}{k} T(2) = -5T(2) \quad (3.1)$$

where we have used the condition of  $T_a = 0.0$  C. We can differentiate (2.3) and substitute it into (3.1) at  $x = 2$  to obtain  $C_2$ , using the derivative boundary condition,

$$\frac{dT}{dx}(2) = \frac{C_2}{2} = -5[100 + C_2 \ln(2)] \quad (3.2)$$

Solving for  $C_2$  we obtain the analytical solution for the temperature distribution,

$$T(x) = 100 \left[ \frac{1 + \ln(1024) - 10 \ln(x)}{1 + \ln(1024)} \right] \quad (3.3)$$

$$T'(x) = -\frac{1}{x} \left[ \frac{1000}{1 + \ln(1024)} \right] \quad (3.4)$$

## II.C. Solution of 117

The solution of problem 117 is the sum of the homogenous solution (2.3) and the inhomogeneous solution for the differential equation in (III) in Figure 1. Equation (III) can be rewritten using  $R = 1.0$  and  $A = -100$ , and integrated twice to obtain the inhomogeneous solution for the temperature distribution  $T$ ,

$$\frac{d}{dx} \left( x \frac{dT}{dx} \right) = -100x(1 + x^2) \quad (4.1)$$

$$x \frac{dT}{dx} = -100 \left( \frac{x^2}{2} + \frac{x^4}{4} \right) \quad (4.2)$$

$$T_{inh}(x) = -100 \left( \frac{x^2}{4} + \frac{x^4}{16} \right) \quad (4.3)$$

Combining (2.3) and (4.3) we obtain the full solution for the temperature distribution,

$$T(x) = C_1 + C_2 \ln(x) - 100 \left( \frac{x^2}{4} + \frac{x^4}{16} \right) \quad (4.4)$$

$$T'(x) = \frac{C_2}{x} - 100 \left( \frac{x}{2} + \frac{x^3}{4} \right) \quad (4.5)$$

Applying the boundary condition  $T(1) = 1$  to (4.4), we obtain  $C_1 = 125/4$ . Applying the boundary condition  $T'(0) = 0$  to (4.5), we find that  $C_2$  must be zero, which results in the solution,

$$T(x) = \frac{125}{4} - 100 \left( \frac{x^2}{4} + \frac{x^4}{16} \right) \quad (4.6)$$

$$T'(x) = -25x(2 + x^2) \quad (4.7)$$

## III. FORMULATION OF DIFFERENCE EQUATIONS

In this section we use finite difference formulas in place of the derivatives in the relevant differential equation. This gives us an approximation of the temperature distribution at discrete points, where the acquired values of the temperature will depend on the finite difference formulas used. We will first use 2<sup>nd</sup> order difference formulas, for which the truncation error will be of the order of the square of the spacing  $\Delta x$ , and then 4<sup>th</sup> order difference formulas, for which the truncation error will be of the order of the fourth power of the spacing  $\Delta x$ .

### **III.a. 2<sup>nd</sup> Order FDM**

For the 2<sup>nd</sup> order method, we replace the derivative terms in the expanded form of Equation (1) with finite difference formulas that have a truncation error of the order of  $\Delta x^2$ . For the first derivative, this will be the two-point central difference, and for the second derivative the three-point central difference,

$$T'(x_i) = \frac{T(x_{i+1}) - T(x_{i-1}))}{2\Delta x} + H.O.T. \quad (5.1)$$

$$T''(x_i) = \frac{T(x_{i+1}) - 2T(x_i) + T(x_{i-1}))}{\Delta x^2} + H.O.T. \quad (5.2)$$

Neglecting the higher order terms and substituting these formulas into (1) we obtain the 2<sup>nd</sup> order finite difference,

$$x_i \frac{T(x_{i+1}) - 2T(x_i) + T(x_{i-1}))}{\Delta x^2} + \frac{T(x_{i+1}) - T(x_{i-1}))}{2\Delta x} = x_i f(x_i) \quad (5.3)$$

Rearranging (5.3), we obtain

$$\left(x_i - \frac{\Delta x}{2}\right) T(x_{i-1}) - 2x_i T(x_i) + \left(x_i + \frac{\Delta x}{2}\right) T(x_{i+1}) = x_i \Delta x^2 f(x_i) \quad (5.4)$$

### **III.b. 4<sup>th</sup> Order FDM**

For the 4<sup>th</sup> order method, we use the same difference formulas as in the 2<sup>nd</sup> order method, except we keep terms of the order of higher order terms, leading to the approximations,

$$T'(x_i) = \frac{T(x_{i+1}) - T(x_{i-1}))}{2\Delta x} - \frac{\Delta x^2}{6} T'''(x_i) + H.O.T. \quad (5.5)$$

$$T''(x_i) = \frac{T(x_{i+1}) - 2T(x_i) + T(x_{i-1}))}{\Delta x^2} - \frac{\Delta x^2}{12} T^{iv}(x_i) + H.O.T. \quad (5.6)$$

In order to use these formulas, we have to derive expressions for  $T'''$  and  $T^{iv}$  from Equation (1),

$$T'''(x) = -\frac{2}{x} T''(x) + f'(x) + \frac{f(x)}{x} \quad (5.7)$$

$$T^{iv}(x) = -\frac{3}{x} T'''(x) + \frac{2}{x} f'(x) + f''(x) = -\frac{3}{x} \left[ -\frac{2}{x} T''(x) + f'(x) + \frac{f(x)}{x} \right] + \frac{2}{x} f'(x) + f''(x) \quad (5.8)$$

Equation (5.8) can be substituted into (5.6) to derive a formula for  $T''$ , which can then substituted into (5.7) to determine  $T'''$ , which can then be substituted into (5.5) to obtain  $T'$ . The results of this procedure are,

$$T''(x_i) = \frac{T(x_{i+1}) - 2T(x_i) + T(x_{i-1}))}{\alpha \Delta x^2} - \frac{\Delta x^2}{12\alpha} \left( f''(x_i) - 3 \frac{f(x_i)}{x_i^2} - \frac{f'(x_i)}{x_i} \right) \quad (5.9)$$

$$T'(x_i) = \frac{T(x_{i+1}) - T(x_{i-1}))}{2\Delta x} - \frac{\Delta x^2}{6} \left[ -\frac{2}{x_i} T''(x_i) + f'(x_i) + \frac{f(x_i)}{x_i} \right] \quad (5.10)$$

where  $\alpha = 1 + \frac{\Delta x^2}{2x_i^2}$ . We can now substitute these equations into Equation (1) to obtain a system of equations,

$$\begin{aligned} & \left( \frac{1}{\alpha \Delta x^2} + \frac{1}{3\alpha x_i^2} - \frac{1}{2x_i \Delta x} \right) T_{i-1} - \left( \frac{2}{\alpha \Delta x^2} + \frac{2}{3\alpha x_i^2} \right) T_i + \left( \frac{1}{\alpha \Delta x^2} + \frac{1}{3\alpha x_i^2} + \frac{1}{2x_i \Delta x} \right) T_{i+1} \\ & = \left( 1 + \frac{\Delta x^2}{6x_i^2} \right) f_i + \left( \frac{\Delta x^2}{6x_i} \right) f_i' + \frac{\Delta x^2}{12\alpha} \left( 1 + \frac{\Delta x^2}{3x_i^2} \right) \left( f_i'' - \frac{1}{x_i} f_i' - \frac{3}{x_i^2} f_i \right) \end{aligned} \quad (5.11)$$

where  $f_i, f_i'$ , and  $f_i''$ , are  $f(x_i), f'(x_i)$ , and  $f''(x_i)$ , respectively, and  $T_{i-1}, T_i$ , and  $T_{i+1}$  are  $T(x_{i-1}), T(x_i)$ , and  $T(x_{i+1})$ , respectively.

### III.A. Formulation for 115

#### III.A.a. *2<sup>nd</sup> Order FDM*

For problem 115,  $f(x) = 0$ , and Equation (5.4) therefore reduces to

$$\left( x_i - \frac{\Delta x}{2} \right) T(x_{i-1}) - 2x_i T(x_i) + \left( x_i + \frac{\Delta x}{2} \right) T(x_{i+1}) = 0 \quad (5.12)$$

This represents a system of equations for the 2<sup>nd</sup> order finite difference approximation to the temperature distribution. The boundary conditions for this problem give us the temperatures at the boundaries, which enables us to solve this system of equations in matrix form without any additional equations.

#### III.A.b. *4<sup>th</sup> Order FDM*

For the 4<sup>th</sup> order approximation, we simply set the r.h.s. of (5.11) equal to zero to obtain a tridiagonal system of equations for temperatures between the boundaries. We obtain a matrix equation that enables us to solve for the interior temperatures.

### III.B. Formulation for 116

Since we do not have the boundary condition at the outer boundary, we have to introduce an extra equation for the outer boundary using Fourier's Law.

#### III.B.a. *2<sup>nd</sup> Order FDM*

For the 2<sup>nd</sup> order method we use Equation (5.4) for the interior points, and the temperature value at the inner boundary is given. To derive a relation for the outer boundary, we substitute the 2-point central difference formula (5.1) into (3.1) to obtain a system of equations,

$$T(x_{i-1}) - 10\Delta x T(x_i) - T(x_{i+1}) = 0 \quad (6.1)$$

We then substitute this equation into Equation (5.4) for  $T(x_{i+1})$  to obtain the equation for the outer boundary,

$$x_N T(x_{N-1}) - \left[ x_N + 5\Delta x \left( x_N + \frac{\Delta x}{2} \right) \right] T(x_N) = 0 \quad (6.2)$$

Equation (5.6) can be combined with the system of equations generated by Equation (5.4) to find the temperature values of the interior points as well as that of the outer boundary.

### **III.B.b. 4<sup>th</sup> Order FDM**

For the 4<sup>th</sup> order finite difference method, the system of equations for the interior points is defined by Equation (5.11) with the r.h.s. set to zero. To obtain the equation at the outer boundary we use the 4<sup>th</sup> order difference equation for  $T'$ , which is (5.10), and substitute into (3.1) using  $f(x) = 0$  to obtain,

$$\left(\frac{1}{3\alpha x_N} - \frac{1}{2\Delta x}\right)T(x_{N-1}) + \left(5 - \frac{2}{3\alpha x_N}\right)T(x_N) + \left(\frac{1}{2\Delta x} + \frac{1}{3\alpha x_N}\right)T(x_{N+1}) = 0 \quad (6.3)$$

We then solve this equation for  $T(x_{i+1})$  and substitute back into Equation (5.11) to obtain,

$$\left[\frac{1}{\alpha\Delta x^2} + \frac{1}{3\alpha x_N^2} - \frac{1}{2x_N\Delta x} + \frac{1}{\gamma}\left(\frac{1}{2\Delta x} - \frac{1}{3\alpha x_N}\right)\left(\frac{1}{\alpha\Delta x^2} + \frac{1}{3\alpha x_N^2} + \frac{1}{2x_N\Delta x}\right)\right]T(x_{N-1}) - \left[\frac{2}{\alpha\Delta x^2} + \frac{2}{3\alpha x_N^2} + \frac{1}{\gamma}\left(5 - \frac{2}{3\alpha x_N}\right)\left(\frac{1}{\alpha\Delta x^2} + \frac{1}{3\alpha x_N^2} + \frac{1}{2x_N\Delta x}\right)\right]T(x_N) = 0 \quad (6.4)$$

where  $\gamma = \left(\frac{1}{2\Delta x} + \frac{1}{3\alpha x_N}\right)$ .

## **III.C. Formulation for 117**

### **III.C.a. 2<sup>nd</sup> Order FDM**

For the 2<sup>nd</sup> order method, Equation (5.4) is used to find the values of the temperature at the interior points of the selected grid, with the function  $f(x)$  being,

$$f(x_i) = -100(1 + x_i^2) \quad (7.1)$$

We already have the value of the temperature at the exterior boundary, but we do not have a value for the interior boundary. For the 2<sup>nd</sup> order method, we use the boundary condition at the interior,  $T'(0) = 0$ , and equate it with a first order approximation,

$$T'(0) = \frac{T(x_1) - T(0)}{\Delta x} = 0 \quad \xrightarrow{\text{yields}} \quad T(0) = T(x_1) \quad (7.2)$$

Therefore, we will equate the temperature at the interior boundary with the temperature value of the adjacent grid point.

### **III.C.b. 4<sup>th</sup> Order FDM**

For the 4<sup>th</sup> order method, Equation (5.11) is used to find the temperature values at the interior grid points using Equation (7.1) for  $f(x)$ . For the value of the temperature at the interior boundary, we use the Taylor series expansion at the adjacent grid point,

$$T(x_1) = T(0) + \Delta x T'(0) + \frac{\Delta x^2}{2} T''(0) + \frac{\Delta x^3}{6} T'''(0) + O(\Delta x^4) \quad (7.3)$$

From the boundary conditions we know the second term on the r.h.s. of Equation (7.3) is zero. In order to derive values for the higher order derivatives, we use Equation (1) and differentiate to obtain,

$$xT'''(x) + 2T''(x) = xf'(x) + f(x) \quad (7.4)$$

At the interior boundary,  $x = 0$ , Equation (7.4) yields the result,

$$T''(0) = \frac{f(0)}{2} \quad (7.5)$$

Differentiating Equation (7.4), we obtain,

$$xT^{iv}(x) + 3T'''(x) = xf''(x) + 2f'(x) \quad (7.6)$$

At  $x = 0$ , this equation yields the result,

$$T'''(0) = \frac{2f'(0)}{3} = 0 \quad (7.7)$$

where we have used Equation (7.1) to determine the value of  $f'(0)$ . Substituting the results of Equations (7.1), (7.5) and (7.7) into Equation (7.3), we find,

$$T(0) - T(x_1) = -\frac{\Delta x^2}{4} f(0) = 25\Delta x^2 \quad (7.8)$$

Equation (7.8) can be used in combination with the tridiagonal matrix formed by applying Equation (5.11) for a specific value of the grid spacing  $\Delta x$  to find values for the interior points as well as for the inner boundary.

### III.D. Difference Equations for the Derivative at the Outer Boundary

The value of the derivative at the boundary requires a different formulation than for the interior points, as we can only use two-points to determine the derivative.

#### III.D.a. 4<sup>th</sup> Order FDM

We begin with the Taylor series expansion for the temperature at the point adjacent to the boundary,

$$T(x_{N-1}) = T(x_N) - \Delta x T'(x_N) + \frac{\Delta x^2}{2} T''(x_N) - \frac{\Delta x^3}{6} T'''(x_N) + \frac{\Delta x^4}{24} T^{iv}(x_N) + O(\Delta x^5) \quad (8.1)$$

where the last term on the r.h.s. is the truncation error. In order to derive an expression for  $T'(x_N)$ , we use Equation (1) to substitute for the higher order derivatives,

$$T''(x_N) = f(x_N) - \frac{1}{x_N} T'(x_N) \quad (8.2)$$

$$T'''(x_N) = f'(x_N) + \frac{f(x_N)}{x_N} - \frac{2}{x_N} T''(x_N) = f'(x_N) - \frac{f(x_N)}{x_N} + \frac{2}{x_N^2} T'(x_N) \quad (8.3)$$

$$T^{iv}(x_N) = f''(x_N) + \frac{f'(x_N)}{x_N} - \frac{3}{x_N} T'''(x_N) = f''(x_N) - \frac{f'(x_N)}{x_N} + \frac{3f(x_N)}{x_N^2} - \frac{6}{x_N^3} T'(x_N) \quad (8.4)$$

We substitute these expressions into Equation (8.1), and rearrange the equation to solve for  $T'(x_N)$ , obtaining,

$$T'(x_N) = \frac{1}{\eta} \left[ \frac{T(x_N) - T(x_{N-1})}{\Delta x} + f(x_N) \left( \frac{\Delta x}{2} + \frac{\Delta x^2}{6x_N} + \frac{\Delta x^3}{8x_N^2} \right) - f'(x_N) \left( \frac{\Delta x^2}{6} + \frac{\Delta x^3}{24x_N} \right) + f''(x_N) \frac{\Delta x^3}{24} \right] \quad (8.5)$$

$$\eta = 1 + \frac{\Delta x}{2x_N} + \frac{\Delta x^2}{3x_N^2} + \frac{\Delta x^3}{4x_N^3}$$

where we have omitted the truncation error, which is of the order of  $\Delta x^4$ . Therefore, this approximation for the derivative of the temperature at the boundary is a 4<sup>th</sup> order approximation.

### **III.D.b.      2<sup>nd</sup> Order FDM**

This approximation can be used to derive a 2<sup>nd</sup> order approximation, where we ignore all derivatives of higher order than 2. The process is identical, and the result is,

$$T'(x_N) = \frac{1}{1 + (\Delta x/2x_N)} \left[ \frac{T(x_N) - T(x_{N-1})}{\Delta x} + f(x_N) \frac{\Delta x}{2} \right] + O(\Delta x^2) \quad (8.6)$$

where the last term on the r.h.s. is the truncation error that is of the desired order.

### **III.E.      Extrapolation Methods**

In this subsection we assume the analytical solution to the three problems are not known, and proceed to analyze the convergence of the finite difference methods outlined in subsections III.A. and III.B. To this end, we utilize two commonly used extrapolation methods.

#### **III.E.a.      Richardson's Extrapolation**

For this method, three distinct values for the quantity of interest,  $Q$ , are required, with the spacing sizes for these values being defined as,

$$\Delta x_a = \Delta x \quad ; \quad \Delta x_b = \frac{\Delta x}{2} \quad ; \quad \Delta x_c = \frac{\Delta x}{4}$$

For each of these spacing sizes, the extrapolated value,  $Q_{EX}$ , will be equal to the calculated value,  $Q_i$ , with a truncation error of the order of  $\Delta x^\beta$ , where  $\beta$  is the convergence rate of the approximation method (e.g. 2<sup>nd</sup> order finite difference  $\beta = 2$ ). Therefore we can write three equations for the extrapolated value of  $Q_{EX}$ ,

$$Q_{EX} = Q_{\Delta x} + C \Delta x^\beta \quad (9.1)$$

$$Q_{EX} = Q_{\Delta x/2} + C \frac{\Delta x^\beta}{2^\beta} \quad (9.2)$$

$$Q_{EX} = Q_{\Delta x/4} + C \frac{\Delta x^\beta}{4^\beta} \quad (9.3)$$

where  $C$  is a constant. We can move the approximated values to the l.h.s. and divide Equation (9.1) by Equation (9.2) to obtain  $2^\beta$ . We can then do the same division with Equation (9.2) and Equation (9.3) to obtain  $2^\beta$  as well,

$$\frac{Q_{EX}-Q_{\Delta x}}{Q_{EX}-Q_{\Delta x/2}} = 2^\beta = \frac{Q_{EX}-Q_{\Delta x/2}}{Q_{EX}-Q_{\Delta x/4}} \quad (9.4)$$

We can now solve for  $Q_{EX}$  in terms of the three approximated values,

$$Q_{EX} = \frac{Q_{\Delta x/2}^2 - Q_{\Delta x} Q_{\Delta x/4}}{2Q_{\Delta x/2} - Q_{\Delta x} - Q_{\Delta x/4}} \quad (9.5)$$

Note that Equation (9.5) does not depend on the convergence rate explicitly. Also of note is that the quantity of values that are extrapolated is limited by the largest grid size,  $\Delta x$ .

### **III.E.b.      *Standard Extrapolation***

In the standard approach to extrapolation, we only use two approximated values with the ratio of their spacing being two, as with Richardson's extrapolation. Therefore, Equations (9.1) and (9.2) are applicable for this approach. We multiply Equation (9.2) by  $2^\beta$ , and subtract Equation (9.1) from this new equation to eliminate the  $\Delta x$  terms. The result of this procedure is the following result for the extrapolated quantity, Equation (9.6),

$$Q_{EX} = \frac{2^\beta Q_{\Delta x/2} - Q_{\Delta x}}{2^\beta - 1} \quad (9.6)$$

Equation (9.6) can be used for both the 2<sup>nd</sup> and 4<sup>th</sup> order finite difference methods, for which the convergence rate,  $\beta$ , will be two and four, respectively. The explicit equations for the 2<sup>nd</sup> and 4<sup>th</sup> order methods are Equation (9.7) and Equation (9.8), respectively,

$$Q_{EX} = \frac{4Q_{\Delta x/2} - Q_{\Delta x}}{3} \quad (9.7)$$

$$Q_{EX} = \frac{16Q_{\Delta x/2} - Q_{\Delta x}}{15} \quad (9.8)$$

## **IV.      SOLUTIONS TO THE DIFFERENCE EQUATIONS**

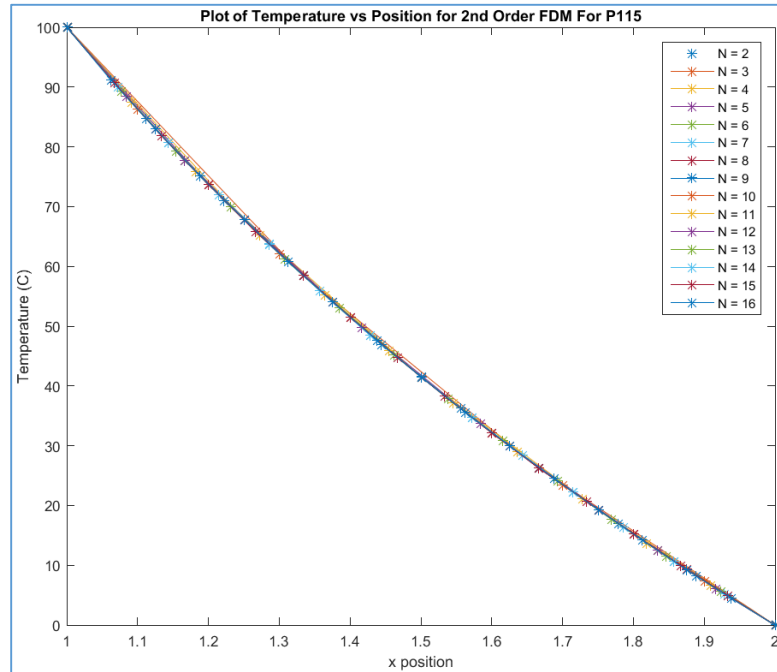

In this section we determine solutions to Equation (5.4) and Equation (5.11) for the cases outlined in problems 115, 116 and 117. All computations and plotting were carried out in the MATLAB® software environment. The symbol  $h$  is used to designate the spacing size  $\Delta x$  in plots where it is used on the horizontal axis label, and “log” refers to the natural logarithm whereas “log10” refers to the base 10 logarithm.

Derivatives for all interior points were calculated using a two-point central difference for the 2<sup>nd</sup> order method, Equation (5.5), and the compact three-point difference for the 4<sup>th</sup> order method, Equations (5.9) and (5.10).

Spacing sizes of  $\Delta x = 1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \frac{1}{6}, \frac{1}{7}, \frac{1}{8}, \frac{1}{9}, \frac{1}{10}, \frac{1}{11}, \frac{1}{12}, \frac{1}{13}, \frac{1}{14}, \frac{1}{15}, \frac{1}{16}$  correspond to interval quantities  $N = 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16$ , respectively.

#### IV.A. FDM Solutions to 115

The temperature distribution calculated using Equation (5.12) for P115 is shown in Figure 2. MATLAB code files 'P115.m' and 'Order2FDM.m' were used to generate the plot.

**Figure 2: Plot of Temperature for P115 using 2<sup>nd</sup> Order FDM.**

Figure 3 displays a plot of the first derivative of the temperature, generated using the same files.

**Figure 3: Plot of Derivative of Temperature for P115 using 2<sup>nd</sup> Order FDM.**

Figure 4 shows the relative error values of the first derivative of the temperature for each spacing size, in log-log format, for the 2<sup>nd</sup> order FDM using the same code files. The error clearly decreases with decreasing spacing size.

**Figure 4: Plot of Relative Error for the First Derivative of the Temperature for P115 - 2<sup>nd</sup> Order FDM.**

Figures 5, 6, and 7 were generated using files 'P115.m' and 'Order4FDM.m'.

## V. CONVERGENCE ANALYSIS

From the solutions in part IV, it is clear that the 4<sup>th</sup> order FDM approximations converge to a solution faster than the 2<sup>nd</sup> order FDM approximations. In fact, as shown in section III.E, the solutions found using the 2<sup>nd</sup> and 4<sup>th</sup> order methods should converge to the exact solution with the 2<sup>nd</sup> and 4<sup>th</sup> power of the spacing size, respectively. If we take the logarithm of these functions, it is apparent that the 2<sup>nd</sup> and 4<sup>th</sup> order approximations should converge to the exact solutions as a function of decreasing spacing size,  $\Delta x$ . Specifically, on a log-log plot, the convergence will be linear, with the slope of the line being equal to the order of the approximation method. This means the slope of the lines on the log-log plot will be 2 for the 2<sup>nd</sup> order method, and 4 for the second order method. This reasoning lays the foundation for our analysis of the convergence of the approximations to the exact or extrapolated solutions as a function of the spacing size.

As a foreword, unless otherwise mentioned, the approximate solutions shown on figures displaying convergence are taken at the midpoint of the range of x-values. For problems 115 and 116, this will be  $x = 1.5$ , and for problem 117 this will be  $x = 0.5$ .

Regarding the convergence plots using an extrapolation method, the standard extrapolation (quadratic or quartic) was used in all cases due to the error being lower than the error for the Richardson's extrapolation values. This can be seen in figures 22, 23, 30, 31, 36, and 37, where the standard extrapolation error is lower than the Richardson's extrapolation error in all cases. In addition, the standard extrapolation methods provide us with seven extrapolated values with the grid spacing sizes we used, whereas with Richardson's extrapolation we can only obtain four extrapolated values.

In the graphs displaying the error for the extrapolation methods, the terms "QuadEx" refer to values derived using quadratic extrapolation, "QuartEx" refer to values derived using quartic extrapolation, and "RichEx" refer to values derived using Richardson's extrapolation.

In all convergence plots, the linear fits are within 0.5 of the nominal slope values of two and four for the corresponding approximation methods, as predicted.

### V.A. Convergence Analysis for 115

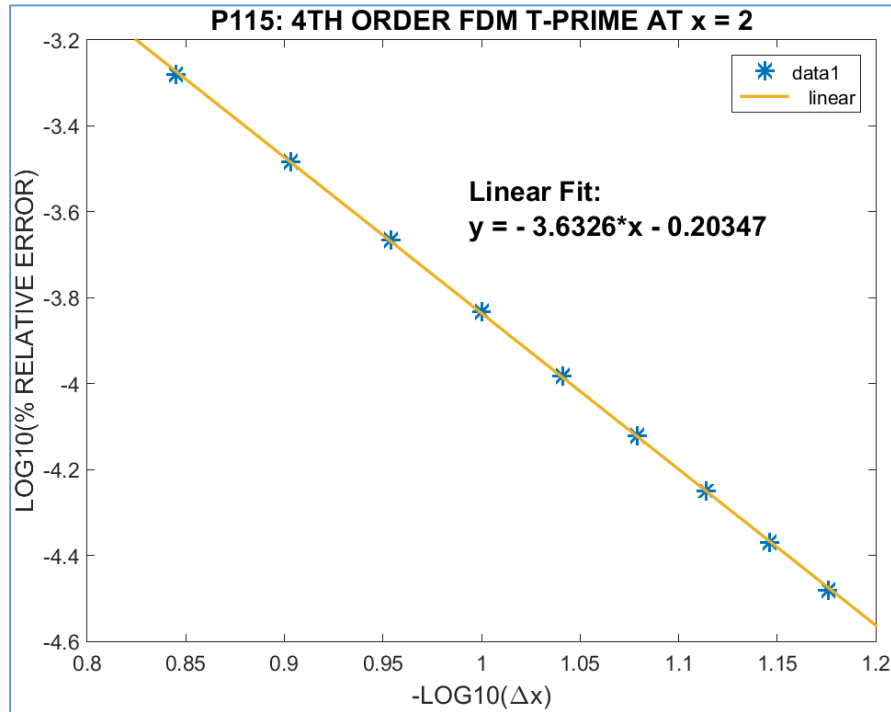

Figures 20 and 21 show the convergence of the 2<sup>nd</sup> and 4<sup>th</sup> order approximations to the derivative of the temperature at the outer boundary, respectively. The slopes are near the nominal values, and would most likely be closer to the nominal values with finer grid spacing sizes.

Figures 22 and 23 show the error of the first derivative values derived using extrapolation methods with respect to the exact solutions found in part II.A. Figure 24 shows the convergence of the FDM solutions to the exact and extrapolated solutions for the Temperature at  $x = 1.5$ . Figure 25 shows the convergence of the FDM solutions to the exact and extrapolated solutions for the first derivative of the temperature at  $x = 1.5$ . Once again, the slope values for the linear fits to the FDM values are close to the expected 2 and 4 for the 2<sup>nd</sup> and 4<sup>th</sup> order methods,

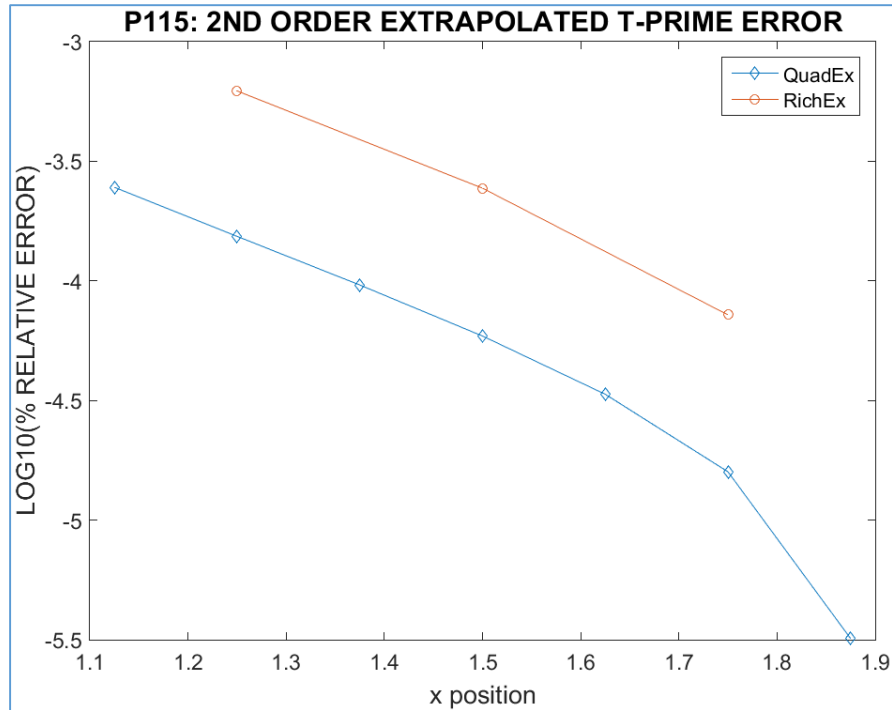

respectively.

### V.B. Convergence Analysis for 116

Figures 26 and 28 show the convergence of the 2<sup>nd</sup> and 4<sup>th</sup> order approximations to the temperature at the outer boundary, respectively. Figures 27 and 29 show the convergence of the 2<sup>nd</sup> and 4<sup>th</sup> order approximations to the derivative of the temperature at the outer boundary, respectively. Figures 30 and 31 show the error of the first derivative values derived using extrapolation methods with respect to the exact solutions found in part II.B. Figure 32 shows the convergence of the FDM solutions to the exact and extrapolated solutions for the Temperature at  $x = 1.5$ . Figure 33 shows the convergence of the FDM solutions to the exact and extrapolated solutions for the first derivative of the temperature at  $x = 1.5$ . Once again, the slope values for the linear fits to the FDM values are close to the expected 2 and 4 for the 2<sup>nd</sup> and 4<sup>th</sup> order methods, respectively.

### V.C. Convergence Analysis for 117

Figures 34 and 35 show the convergence of the 2<sup>nd</sup> and 4<sup>th</sup> order approximations to the derivative of the temperature at the outer boundary, respectively. Figures 36 and 37 show the error of the first derivative values derived using extrapolation methods with respect to the exact solutions found in part II.B. Figure 38 shows the convergence of the FDM solutions to the exact and extrapolated solutions for the Temperature at  $x = 0.5$ . Figure 39 shows the convergence of the FDM solutions to the exact and extrapolated solutions for the first derivative of the temperature at  $x = 0.5$ . Once again, the slope values for the linear fits to the FDM values are close to the expected 2 and 4 for the 2<sup>nd</sup> and 4<sup>th</sup> order methods, respectively.

## APPENDIX A. DATA TABLES

In this appendix, we list all relevant data acquired in sections IV and V. In the tables that follow, the symbol “T” refers to the value of the temperature calculated using a numerical method, whereas the symbol “ $\check{T}$ ” refers to the analytically derived exact value of the temperature. Similarly, the symbol “T’ ” refers to the value of the derivative of the temperature calculated using a numerical method, whereas the symbol “ $\check{T}'$  ” refers to the analytically derived exact value of the derivative of the temperature. The symbol “e” refers to the difference between the calculated and exact values of the relevant quantities in each table.
